

1) Partition θ into blocks

2) Select a block based on Gauss-Soutwell rule:

$$\|\nabla_{\mathbf{i}} f_{z,y}(\theta)\| \geq \tau \|\nabla f_{z,y}(\theta)\|$$

3) Update the weights of the selected block:

$$\min_{\theta_2} f_{z,y}(\theta_1, \theta_2, \theta_3)$$

... repeat
